3 Product Owner verification sheet **10**

1 Purpose and verification criteria

The document collects 18 user stories with observable and verifiable acceptance conditions. For each user story, the Product Owner can verify the individual criteria before acceptance. The criteria express the expected behavior and do not prescribe a technological implementation.

Definitions. Fixed stop: a place that is part of the route established by the editor. Segment: the stretch between two consecutive fixed stops. Optional experience: an activity proposed by an operator, associated with a segment and selectable by the tourist after approval.

Explicit assumptions used in the specification: (i) an itinerary must have at least two stops to be published; (ii) approval of proposals is the editor's responsibility; (iii) prices are in euros per person, with no purchase functionality; (iv) geographic relevance is given by the distance from at least one segment within a configurable radius; (v) editing of stops applies to draft itineraries. These assumptions must be confirmed by the Product Owner before release.

Done Done rule. A story can be accepted by the Product Owner when all of its acceptance conditions have been verified in the agreed environment, the results are recorded, and there are no open blocking defects. In addition, compliance with the team's Definition of Done (e.g., automated tests, code review and integration) is required, without confusing it with the story's functional criteria alone.

2 User stories and acceptance conditions

2.1 Epic 1 – Creating and managing itineraries

2.1.1 US01

Actor	User story description	Acceptance condition
Editor	As an editor, I want to create a new thematic itinerary in draft status, so that I can progressively define its contents before publication.	**AC01.** An authenticated editor can create an itinerary by specifying at least title, theme, description and geographic area.
		AC02. Upon creation, the itinerary takes the Draft status and does not appear in the public catalog.
		AC03. The system assigns a unique identifier to the itinerary and records the responsible editor.
		AC04. If a mandatory field is missing or invalid, the system reports the problem and does not save the itinerary.
		AC05. The editor can reopen the draft and find the previously saved data.

2.1.2 US02

Actor	User story description	Acceptance condition
Editor	As an editor, I want to add and edit the geolocated fixed stops of an itinerary, so that I can identify the places of interest that make up the route.	**AC01.** For a draft itinerary, the editor can add a stop by specifying at least name, description and geographic coordinates.
		AC02. The added stop appears in the itinerary's list of stops and on the map representation.
		AC03. The editor can edit a stop's data and see the changes after saving.
		AC04. The system rejects coordinates outside the valid ranges (latitude from -90 to 90; longitude from -180 to 180).
		AC05. An unauthorized editor cannot modify the itinerary's stops.

2.1.3 US03

Actor	User story description	Acceptance condition
Editor	As an editor, I want to define and modify the order of an itinerary's fixed stops, so that I can establish the sequence in which the places of interest are to be visited.	**AC01.** The editor can set an explicit sequence for the stops in the draft itinerary.
		AC02. After reordering and saving, the system displays the stops in the chosen order.
		AC03. The sequence cannot contain accidental duplicates or references to stops that do not belong to the itinerary.
		AC04. The route segments are recalculated between each pair of consecutive stops.
		AC05. Changes to the order do not alter the stops' descriptive or geographic data.

2.1.4 US04

Actor	User story description	Acceptance condition
Editor	As an editor, I want to publish an itinerary while keeping the order of the defined fixed stops, so that tourists can browse the route I designed.	**AC01.** Only an itinerary with title, theme, description and at least two valid fixed stops can be published.
		AC02. When the editor confirms publication, the status changes from Draft to Published.
		AC03. A published itinerary appears in the catalog that tourists can browse.

Actor	User story description	Acceptance condition (continued)
		AC04. The tourist sees exactly the fixed stops and their order as saved at the time of publication.
		AC05. The system prevents publication and shows the shortcomings if the prerequisites are not met.
		AC06. Publication does not automatically open the itinerary to participation by operators.

2.2 Epic 2 – Browsing itineraries

2.2.1 US05

Actor	User story description	Acceptance condition
Tourist	As a tourist, I want to browse the published thematic itineraries, so that I can find visit routes consistent with my interests.	**AC01.** The tourist can view the list of itineraries in Published status without authenticating.
		AC02. For each itinerary, at least title, theme and a short description are shown.
		AC03. When opening an itinerary, the tourist sees the description, the fixed stops in order and their position on the map.
		AC04. Itineraries in Draft status do not appear in the list and cannot be browsed through the public views.
		AC05. When there are no published itineraries, the system shows an understandable message instead of an empty list with no explanation.

2.3 Epic 3 – Participation of economic operators

2.3.1 US06

Actor	User story description	Acceptance condition
Editor	As an editor, I want to open an itinerary to participation by economic operators, so that they can propose optional experiences to associate with its segments.	**AC01.** The editor can set the participation status of a published itinerary to Open.
		AC02. When participation is Open, operators can submit proposals referring to the itinerary's segments.
		AC03. When participation is Closed, no new proposals can be submitted.

Actor	User story description	Acceptance condition (continued)
		AC04. The itinerary's Published status does not change following the opening or closing of participation.
		AC05. Changing the participation status is allowed only to an authorized editor.

2.3.2 US07

Actor	User story description	Acceptance condition
Economic operator	As an economic operator, I want to propose one of my experiences by associating it with a specific segment of an itinerary open to participation, so that I can offer my services to tourists following that itinerary.	**AC01.** The authenticated operator can select an open itinerary and one of its existing segments.
		AC02. The proposal contains at least title, description, geographic location, associated segment and price indication.
		AC03. Upon submission of valid data, the system saves the proposal in the Pending approval status and associates it with the operator.
		AC04. If mandatory fields are missing, the system does not save the proposal and flags what to correct.
		AC05. It is not possible to propose experiences on itineraries with Closed participation.
		AC06. A proposal that has not been approved cannot be selected by the tourist.

2.3.3 US08

Actor	User story description	Acceptance condition
Economic operator	As an economic operator, I want to specify whether a proposed experience is free or paid and indicate its price, if any, so that tourists can assess its cost before selecting it.	**AC01.** The operator can explicitly indicate Free or Paid for each experience.
		AC02. For a Free experience, the stored and displayed cost is zero.
		AC03. For a Paid experience, a numeric price greater than zero, expressed in euros per person, is mandatory.
		AC04. The system rejects negative, non-numeric or missing amounts for a paid experience.
		AC05. The tourist clearly sees the price per person, if any, before selecting the experience.

2.3.4 US09

Actor	User story description	Acceptance condition
Economic operator	As an economic operator, I want to find the itineraries open to participation that cross the territory in which I operate, so that I can identify opportunities to propose my experiences.	**AC01.** The operator can indicate a geographic location and a search radius expressed in kilometers.
		AC02. The system returns the published itineraries, open to participation, with at least one segment within the chosen radius.
		AC03. For each result, the itinerary's title and the relevant segments are visible.
		AC04. Itineraries closed to participation are not returned as eligible opportunities.
		AC05. If there are no matches, the system reports that no relevant itineraries were found.

2.3.5 US10

Actor	User story description	Acceptance condition
Economic operator	As an economic operator, I want to receive a notification when an itinerary relevant to my area of activity is opened to participation, so that I can promptly identify new opportunities to promote my services.	**AC01.** The operator can enable or disable notifications and set a location and radius of interest.
		AC02. When an itinerary becomes Open, the system checks its relevance against the saved preferences.
		AC03. If notifications are enabled and at least one segment is within the radius, a notification is created in the operator's personal area.
		AC04. The notification identifies the itinerary and contains a link to its page.
		AC05. The same opening does not generate duplicate notifications for the same operator.
		AC06. Operators who have disabled notifications do not receive new ones.

2.4 Epic 4 – Itinerary personalization

2.4.1 US11

Actor	User story description	Acceptance condition
Tourist	As a tourist, I want to select and deselect the optional experiences associated with an itinerary's segments, so that I can personalize the route according to my interests.	**AC01.** The tourist can select only approved experiences available for the itinerary being viewed.
		AC02. A selected experience is visually recognizable and can be deselected.
		AC03. Deselection removes the experience from the current personalization.
		AC04. The order and presence of the fixed stops remain unchanged during selection and deselection.
		AC05. Selecting an experience does not automatically introduce a booking or a payment.

2.4.2 US12

Actor	User story description	Acceptance condition
Tourist	As a tourist, I want to see the total cost of the selected optional experiences, so that I can assess the expected expense for the personalized route.	**AC01.** The system displays the sum in euros of the per-person prices of the selected experiences only.
		AC02. Selecting a new paid experience increases the total by its price.
		AC03. Deselecting a paid experience decreases the total by its price.
		AC04. Free experiences contribute zero to the total.
		AC05. With no experiences selected, the displayed total is 0.00 euros.
		AC06. The value is clearly qualified as the cost of the selected experiences for one person, not as the total cost of the trip.

2.4.3 US13

Actor	User story description	Acceptance condition
Tourist	As a tourist, I want to obtain a summary of my personalized itinerary, including the fixed stops and the selected optional experiences, so that I can review the route I intend to take.	**AC01.** The tourist can open a summary of the itinerary they are personalizing.
		AC02. The summary presents all the fixed stops in the order defined by the editor.

Actor	User story description	Acceptance condition (continued)
		AC03. The selected experiences are listed indicating the segment they are associated with.
		AC04. Experiences that are not selected do not appear among the chosen activities.
		AC05. The summary reports the total cost per person consistent with the current selection.
		AC06. If the tourist does not select optional experiences, the summary still shows the itinerary of fixed stops.

2.4.4 US17

Actor	User story description	Acceptance condition
Tourist	As a tourist, I want to see the optional experiences available along the itinerary's segments, so that I can learn about the visit opportunities and the activities offered by operators.	**AC01.** The itinerary page shows the approved experiences associated with each segment.
		AC02. For each experience, at least title, short description, location, operator and price or a Free indication are visible.
		AC03. Experiences that are pending, rejected or withdrawn do not appear among those available.
		AC04. The tourist can clearly distinguish fixed stops from optional experiences.
		AC05. When a segment offers no optional experiences, it remains browsable and the absence of experiences is indicated.

2.4.5 US18

Actor	User story description	Acceptance condition
Tourist	As a tourist, I want to see on a map the fixed stops and the selected experiences, so that I can understand the geographic distribution of the activities I intend to carry out.	**AC01.** The map shows all of the itinerary's fixed stops, in route order.
		AC02. The map highlights the selected optional experiences, graphically distinguishing them from the fixed stops.
		AC03. Experiences that are not selected are not highlighted as part of the personalized route.
		AC04. When an experience is selected or deselected, the map is updated consistently.
		AC05. Every element shown on the map can be traced back to the corresponding stop or experience.

Actor	User story description	Acceptance condition (continued)
		AC06. The map does not automatically imply the calculation of driving directions or of an optimized route.

2.5 Epic 5 – Moderation and updating of experiences

2.5.1 US14

Actor	User story description	Acceptance condition
Editor	As an editor, I want to review the experiences proposed by operators for an itinerary, so that I can verify their consistency with the theme and characteristics of the route.	**AC01.** The editor can view the proposals in Pending approval status relating to the itineraries under their responsibility.
		AC02. For each proposal, the system shows operator, description, location, segment and economic conditions.
		AC03. The editor can open the full page without changing the proposal's status.
		AC04. A proposal relating to an itinerary not under the editor's responsibility is not accessible through the editor's moderation functions.
		AC05. Proposals already approved or rejected are distinguishable from pending ones.

2.5.2 US15

Actor	User story description	Acceptance condition
Editor	As an editor, I want to approve or reject the experiences proposed by operators, so that only those deemed consistent with the itinerary are available to tourists.	**AC01.** The authorized editor can approve a proposal in Pending approval status.
		AC02. After approval, the status becomes Approved and the experience is visible and selectable by tourists in the published itinerary.
		AC03. The editor can reject a pending proposal by providing a reason.
		AC04. After rejection, the status becomes Rejected and the experience is not selectable by tourists.
		AC05. The system retains the decision, the date and the identity of the editor who made it.
		AC06. It is not possible to approve or reject a proposal that has already been decided again through the same action.

2.5.3 US16

Actor	User story description	Acceptance condition
Economic operator	As an economic operator, I want to modify or withdraw one of my proposed experiences, so that the published information is always consistent with the services I can actually offer.	**AC01.** The operator can open and modify a proposal they own that is pending approval.
		AC02. A change to the essential data of an already approved proposal suspends its visibility and returns it to Pending approval.
		AC03. The operator can withdraw one of their own proposals; the status becomes Withdrawn.
		AC04. Withdrawn proposals cannot be selected by tourists, even if previously approved.
		AC05. An operator cannot modify or withdraw proposals belonging to other operators.
		AC06. The system keeps a record of changes and status changes.

3 Product Owner verification sheet

For each story, report ID, version/release, environment and test date, evidence (screenshots, reports or links to tests), the outcome of each AC (Pass/Fail), residual defects and final decision (Accepted/Not accepted). If an AC fails, the story must not be marked Done Done.
